PRODUCT GUIDE / Version 2.4 | October 2026 / SECTION 01

Welcome to TaskFlow

TaskFlow is a fictional cloud workspace for teams that plan projects, manage tasks, and track delivery. This guide explains the end-user product, not the public API.

Workspaces and projects

A workspace contains users, projects, billing settings, and organization-wide access rules. Each project belongs to exactly one workspace and can use List, Board, or Timeline views. A workspace owner chooses its subscription plan.

Projects have an ID, name, optional description, status (Active, Paused, or Archived), and default timezone. Archiving a project preserves its tasks but blocks new task creation until restored. Archived projects count toward plan project limits.

Tasks and collaboration

Each task has a title, optional description, assignee, priority (Low, Medium, High, Urgent), due date, and status (To do, In progress, Blocked, Done). Comments and attachments keep discussions with work. Task activity records changes and is visible to members with project access.

Finding information

- Use project filters for assignee, status, priority, and due date.
- Search matches project names, task titles, and task descriptions within projects you can access.
- Notifications cover assignments, mentions, due-date reminders, and task status changes.

Related documents: Plans & Billing lists plan quotas; Troubleshooting explains failed invitations and missing projects.

PRODUCT GUIDE / Version 2.4 | October 2026 / SECTION 02

Roles and permissions

Permissions are evaluated at workspace level and restricted further by project membership. A role does not grant access to a private project automatically.

Workspace roles

Role	Capabilities
Owner	Manage billing and plan, transfer ownership, invite users, manage every project.
Admin	Invite or deactivate members, create projects, manage project settings; cannot change billing ownership.
Member	Create and edit assigned or accessible project tasks; create projects only when an admin enables member project creation.
Viewer	Read accessible tasks, comments, and dashboards; cannot edit tasks or export data.

Every workspace must retain one active Owner. Only an Owner can transfer ownership. A user can have one workspace role per workspace; project access is inherited for public projects and explicitly granted for private projects.

Sharing rules

- Public projects are visible to all workspace members, including Viewers.
- Private projects are visible only to their invited project members and workspace Owners.
- Export requires both a supported paid plan and Owner, Admin, or Member permissions; Viewers cannot export.

For plan-specific export formats, see Plans & Billing, page 2. For export feature history, see Release Notes, page 2.

PRODUCT GUIDE / Version 2.4 | October 2026 / SECTION 03

Exports and reporting

Use the web interface for operational exports and reporting. Available formats depend on the subscription and user permissions.

How to export a project

- Open a project, choose More actions > Export, select a format, then confirm.
- A generated file includes visible tasks in that project, with task ID, title, status, assignee, priority, and due date. Private tasks are excluded if the user lacks access.
- Exports run asynchronously. A completed export is available in the workspace download center for 24 hours.

Eligibility and availability

Exports are a paid-plan feature. The Free plan does not support project exports. Starter, Pro, and Business users may export if their role permits it. The exact file formats differ by plan and are defined in Plans & Billing, page 2.

CSV export was introduced on March 12, 2025. The feature announcement and its original scope appear in Release Notes, page 2. Current plan entitlements, not the historical announcement, determine what a user can export today.

UI export versus API export

The project export button in the web app is not the same as the API export endpoint. API-generated exports require Pro or Business; Starter supports CSV export through the web interface only. For technical limits and sample requests, see API Guide, page 3.

Reporting basics

All paid plans support basic project dashboards. Advanced cross-project analytics are restricted to Pro and Business; Free and Starter cannot use advanced analytics.

PRODUCT GUIDE / Version 2.4 | October 2026 / SECTION 04

Project setup walkthrough

A reproducible onboarding scenario for sample questions and RAG demonstrations.

Create and organize work

- Create workspace “Acme Demo” and set timezone to UTC. The Owner invites Alex as Admin and Casey as Member.
- Create project “Website Launch,” then tasks “Finalize copy,” “QA landing page,” and “Publish launch.” Set QA landing page to Blocked.
- Add a private project “Budget 2027” with Alex as a project member. Casey cannot see it without an invitation.

Example policy questions

Can Casey export “Website Launch” on Starter? Yes, as a Member, Casey can use the web UI to export CSV, provided Casey can access the project. See Plans & Billing, page 2, for Starter formats.

Can a Viewer download the same CSV? No. Export is prohibited for the Viewer role on every plan; a paid subscription alone is insufficient.

Can Casey see “Budget 2027”? No, because the project is private and Casey is not a member.

More documentation

For storage, seats, and billing policies, read Plans & Billing. For API auth and error codes, read API Guide. For access, export, and webhook failures, read Troubleshooting.
