TROUBLESHOOTING / Updated October 2026 / SECTION 01

Access and visibility issues

Start with account, role, and project membership checks before changing settings or opening a support request.

I cannot see a project

- Confirm you are in the correct workspace (workspace switcher in the upper-left corner).
- If the project is private, ask the project Admin or workspace Owner for membership. Workspace Members and Admins do not automatically see every private project.
- Archived projects can be found using the Archived filter. They cannot accept new tasks until restored.

My invitation link fails

Invitation links expire after 7 days and can be used once. Ask an Owner or Admin to resend an invitation. If your email does not match the invited address, sign in with the intended account.

I cannot edit a task

Viewers cannot edit. Members require project access. An archived project is read-only. If billing grace mode is active, task changes are blocked until the Owner resolves payment (Plans & Billing, page 4).

Quick permission reference

Only Owners manage billing; Owners and Admins invite users; Viewers cannot export. Refer to Product Guide, page 2 for full role definitions.

TROUBLESHOOTING / Updated October 2026 / SECTION 02

API errors and rate limits

Use the HTTP status and error.code from the API response to decide whether to retry or fix configuration.

401 UNAUTHORIZED

Confirm the Authorization header uses Bearer followed by a valid token. Inspect whether the token was revoked, accidentally truncated, or created in a different workspace. A 401 should not be retried unchanged.

403 FEATURE_NOT_INCLUDED during export

If a Starter workspace sends POST /v1/projects/{id}/exports, the API correctly responds with 403 FEATURE_NOT_INCLUDED. Starter API access covers projects and tasks, not API exports. Use CSV export in the web UI or upgrade to Pro. See API Guide, page 3 and Plans & Billing, page 2.

429 RATE_LIMITED

Read the Retry-After response header, wait for the specified duration, and retry with exponential backoff. Per-workspace limits are 60 requests/minute on Starter, 300 on Pro, and 1,200 on Business. Multiple API tokens share the workspace limit.

422 VALIDATION_ERROR

Check required title on task creation and valid enum strings such as in_progress rather than “In Progress”. The canonical API fields and enums are in API Guide, page 2.

404 NOT_FOUND

Check resource IDs and project access. Private resources can return 404 rather than 403 so that their existence is not disclosed.

TROUBLESHOOTING / Updated October 2026 / SECTION 03

Exports, webhooks, and payments

This section separates export policy restrictions from unexpected system errors.

Export option is missing

- Confirm the workspace is on Starter, Pro, or Business; Free has no export feature.
- Confirm your role is Owner, Admin, or Member and that you have access to the project. Viewers never export.
- Confirm the format: Starter CSV; Pro CSV/JSON; Business CSV/JSON/XLSX in the web UI.

If you have reached the daily UI quota (Starter 5, Pro 50, Business 200), try again the next day. Download links expire after 24 hours. See Plans & Billing, page 2.

Webhook deliveries fail

Webhooks require Pro or Business. Verify your endpoint returns HTTP 2xx and validates X-TaskFlow-Signature. TaskFlow retries after 1, 5, and 20 minutes, then marks the delivery failed. See API Guide, page 3.

Payment card declined

Only the workspace Owner can change the payment method in Settings > Billing. TaskFlow retries on days 1, 3, and 7; read-only grace mode begins on day 8 after failed payment. See Plans & Billing, page 4.

Request a refund

First-time annual purchases can be refunded within 14 calendar days; monthly charges and annual renewals are generally non-refundable. See Plans & Billing, page 4 for the complete policy.

TROUBLESHOOTING / Updated October 2026 / SECTION 04

Support checklist and examples

Gather enough context to make failures reproducible while keeping credentials and personal information private.

What to include in a support report

- Workspace ID, project ID if relevant, UTC time, expected behavior, observed behavior, and exact HTTP error code.
- For API errors, include request method/path and a redacted request ID. Never share complete API tokens or webhook secrets.
- For export issues, include workspace plan, selected format, role, and whether the action was in the web UI or API.

Diagnostic examples

Example 1: “I pay for Starter but API CSV export returns 403.” This is expected. Starter has UI CSV export only; API export starts on Pro (API Guide, page 3).

Example 2: “I am a Viewer on Business and cannot export XLSX.” This is expected. The Business plan includes XLSX UI export, but Viewers never have export permissions (Product Guide, page 2).

Example 3: “My CSV export was available yesterday but is gone today.” Export download links expire 24 hours after creation (Plans & Billing, page 2).

Escalation

If entitlement checks pass but a feature still fails, contact support@taskflow.example with the checklist information. This address is fictional and does not route to a real help desk.
